THE PITCH

Creating Currency From Energy.

The first protocol that turns every kWh into a tradable, carbon-backed asset — owned by the homeowner.

THE OPPORTUNITY

Residential solar's $400B problem: homeowners feel **nothing** after install — just a 25-year loan. Churn is the silent killer.

ZenSolar fixes this by turning every kWh into a token the homeowner owns, with a cryptographic receipt that ties production → tokens → CO_2 offset.

The artifact **fixes churn**, drives **word-of-mouth**, and pulls installers in — instead of recruiting them.

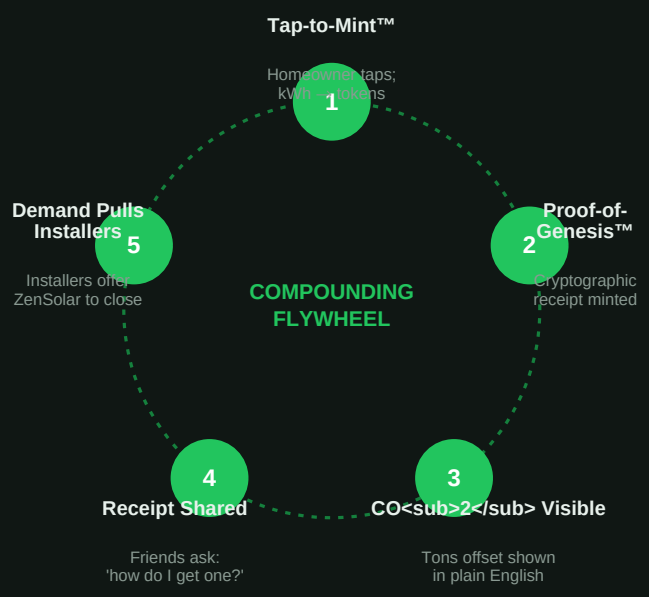
THE PRODUCT · SHIPPED

Proof-of-Genesis™ — the cryptographic receipt that ties verified kWh production to minted $ZSOLAR tokens and CO_2 tons offset. Every mint generates one. Forwardable. Verifiable on-chain.

Tap-to-Mint™ — one-tap mint on the homeowner wallet. Crypto disappears; ownership remains.

CO_2 Tons Offset — every receipt converts kWh → tons in plain English. Dad-friendly. Dinner-party-friendly.

COMPOUNDING FLYWHEEL



TOKENOMICS · 1T HARD CAP

Mint split: 75% homeowner · 20% burn · 3% LP · 2% treasury
Launch: $0.10 USDC, LP-seeded tranches (e.g. $200K USDC + 2M $ZSOLAR per round)
Founders pact-locked: Joseph 150B · Michael 50B
$1T crossovers: $6.67 / $20

WHY LYNDON

SolarCity solved **installation**. ZenSolar solves **what happens after install** — the 25-year emotional flatline between flipping the breaker and paying off the loan.

Same distribution instincts. New asset class.

THE ASK

$5M Seed · 24-month runway to default-alive

Board seat — co-shape the tokenized energy economy from day one. Last raise required to reach default-alive if growth tracks. $208K/mo burn · Series A target Q2–Q4 '27 at $80–120M post.
